

Recruiting Agent

An AI agent built to read documents and turn them into clear, structured decisions.

● Problem

● Method

● Solution Model

From a stack of documents to a clear, structured output.

HOW IT WORKS

- 1 Input document (Inputs)
- 2 Agent reads & extracts
- 3 Compares against criteria
- 4 Delivers structured output

TCS Corporate Presentation

Many applications, hard to compare

THE CHALLENGE

Recruiters often receive a large volume of applications, each with a different format, experience level and background. Reviewing every one in detail takes time — and it's easy to overlook a strong candidate or misjudge how well they actually fit the role.

The opportunity: the agent reads every application, extracts experience level and role fit, and surfaces the strongest candidates — so recruiters decide faster and with more confidence.

HOW THE AGENT SOLVES IT

Four phases to a working solution

Four phases, from problem to demo

SOLUTION MODEL — HOW APPLICATIONS BECOME A SHORTLIST

Every ranking cites the experience or qualification behind it — no black-box scoring.

Tech stack (brief): AI-assisted coding (Claude Code, Codex, Copilot) on a free-tier reading, matching and delivery stack — detail available on request.

What changes, and what's next

Business Impact

Faster shortlists, fewer strong candidates overlooked — recruiters focus on the best fits.

Technical Solidity

A working demo, not a mockup — every score cites its source.

Responsible Scale

No real candidate data, private repo, free-tier only — ready for a supervised pilot.

EXECUTIVE ASK

Pilot the agent with real applications and measure time saved, quality of shortlist, and recruiter confidence.
